Cary,

Here is the progress we have conducted since March 2022:

- We are still experiencing issues with our main AM transmitter for full-power operations. We have continued to diagnose control circuitry issues regarding power startup of voltages within the transmitter but we still have issues that are preventing the transmitter from starting up and staying powered on. We have been working with consultants and the transmitter manufacturer.
- We are also experiencing issues with the directional array that prevent us from going to full-power DA operations. The towers are out of tolerance and it appears that we may need to weld the tower legs to achieve compliant tolerances on towers #2 and #3. Our consultant has been working with the directional array and preparing a proposal to weld the tower legs.

Thanks,

David Hodges  
Vice President of Engineering  
Positive Alternative Radio, Inc.  
Base Communications, Inc.
