We reviewed the actual location of these translator stations. Based on the actual location we

determined the latitude and longitude and the ground elevation from a USGS topographic map.

We are satisfied that the ground elevation of 1966 meters is correct.

The site is in an area where there is rapidly changing terrain so it is not surprising that a ground

elevation derived from the digitized terrain database which unfortunately has quite widely spaced

data points would show a higher number. The topographical maps are more accurate.
